To Whom It May Concern:

On this date I examined a 2019 filly named Amarillo Baygirl. The filly had an old injury to the left hind cannon bone. Radiographs were taken of the area and showed thickened cortex to the dorsal surface of the cannon bone in the area of the scar tissue but showed no significant radiographic changes associated with this wound. In my opinion there should be no future problems associated with this injury.

Please feel free to contact me if there are any questions regarding this matter.

Sincerely,

David E. White DVM
