Rob,

Jen was right to ask you send radiographs because there are several versions of pastern cysts.

We rarely treat this lesion at all. We see quite a few of them in yearlings. We have followed a large number of them thru their career and they don't affect their ability to race. So we may see one of these every five years that is causing lameness. We drill them from the top and debride the joint surface of the cyst through the drill hole. Some people put screws across
